The site, created by Alex Cope and Ben Lamm, the latter of whom will graduate from Stanford University this week, was launched to fill a need in news publishing, as newspapers and news sites are being squeezed as revenue from advertising declines. Under a new partnership with the Wikimedia Foundation, articles that have been edited on Typosnap can be made available on Wikipedia. "We believe that the internet is a public resource, and so we make our content available for anyone to edit and improve," said Cope in a statement. "Because of that, we want to make the most of the public good, as well as make a quick buck, and provide creators with tools to make their content more attractive and profitable." The company will provide licenses to news outlets that are based on the Creative Commons Attribution-NonCommercial license, which means that editors on Typosnap are free to use the content in their own work or in non-commercial contexts, but can't restrict others from using the material. Typosnap works by having volunteers look at text on articles in news outlets like the New York Times, the Guardian, and the Washington Post, fixing errors in it that they can verify in a way that can be explained on the web. The system works by having volunteers look at the text in the news article and mark up where they can, and then other volunteers verify and add their corrections to the article. The process is done by viewing the text in the article, adding notes, then viewing the notes again, adding more notes, and so on. To do this, Typosnap is using web-based video editing software called OBS, which it licenses under a Creative Commons Attribution-NonCommercial-ShareAlike license. So long as a news outlet has a CC license on its work, Typosnap will be able to make a video that anyone can edit that includes the work, and then offer that video for other editors to use, but that can't restrict others from using 2d92ce491b
